E192/E382

Use of the

f is the focus of the photocarbine, D is the dimension of the target, K is the transverse dimension of the target, d_2 is the longitudinal dimension of the target on the photograph and d_1 is the transverse dimension of the target on the photograph. If the data of the target are known, it is possible to determine φ and L ; when these are not known, only φ can be calculated. The errors in the bombing can be determined by comparing the calculated data and the actual figures of the photobombing with the tabulated bombing data and taking into account the relationship between the conditions of flight and the aiming of the bomb. Evaluation of the errors in bombing is based on determining the error due to variation in the predetermined flight velocity (ΔV) and the error due to variation in the height of flight (ΔH). These are directly proportional to ΔV and ΔH and can easily be calculated. There are 3 figures and 1 table.

Title : Protective and Stabilizing Effect of the Hydrosol of Iron Orthohydroxide in a Mixed Sol of Trivalent Iron Hydroxides.

Orig Pub : Roczn. chem., 1958, 32, No 6, 1397-1400

Abstract : Acid peptization of the x-ray crystalline Fe-hydroxides: γ -FeOOH and goethite (α -Fe₂O₃·H₂O) leads to the formation of yellow turbid hydrophobic sols which leave a deposit on glassware. The red hydrosols produced in the peptization of x-ray amorphous Fe orthohydroxide are transparent and stable. It was shown by means of sedimentation measurements and measurements of the degree of precipitation by starch that the orthosol protects the γ -FeOOH-sol in mixed hydrosols; half the weight of

Properties, uses, and manufacture of pure silicon. Jaroslav Jagoš (Tech. Univ., Kufice, Czech.). *Sborník* ~~Prac. Vysoké školy Tech. Kufice~~ 1957, 95-107. Among the phys. and chem. properties mentioned, the most important is the sp. resistance, which is a good criterion of purity. Applications in the manuf. of diodes, transistors, photocells, and SiO films are described. Nine methods of prepn. of Si are given, the following 4 of them in detail: (1) the method of R. Hölbling (C.A. 21, 3107), in which SiCl_4 is reduced with H_2 ; (2) the method of Beketov as developed by D. W. Lyon, C. M. Olson, and E. D. Lewis (C.A. 44, 961a), in which SiCl_4 is reduced with Zn; (3) the method of F. B. Litton and H. C. Anderson (C.A. 50, 90d), in which SiH_4 is decomposed thermally on a Ta filament; (4) the method of Wartenberg (C.A. 46, 7452c; 50, 11149g), using electrolysis of molten K_2SiF_6 . Five methods of purification are mentioned, of which the method of zone refining (G. Schreiber and R. Schubert (C.A. 51, 6260c); R. Kneis, Z. Naturforsch. 9a, 67(1954)) is stressed. H. Newcombe

TITLE: Radiator filling-cap

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk. 42. Silovyye ustanovki, no. 14, 1962. 56, abstract 42.14.340 (Czech patent, class 46 c-4, 11, no. 93651, January 15, 1960)

TEXT: A design for a high-pressure radiator cap is proposed. The cap is provided with three packings. The external packing closes tightly the filling hole of the radiator; the intermediate packing serves as a safety valve of the spring type, adjustable within a pressure limit of 0.01 atm; the third packing represents a check valve for the inlet of air into the radiator in case of vacuum formation in the latter. The radiator cap is provided with a special button for reduction of vapor pressure within the radiator. There is 1 figure.
